

AnaLASER® II

Can it really make a difference?

Yes! Fenwal pioneered the technology of high sensitivity smoke detection.

The graph above depicts a fire incident at one of our customers. AnaLASER® II detected the fire during the incipient stage 3 hours before the suppression system discharged and extinguished the fire.

- Prealarm was activated, audible and visual notifications were activated 60 minutes prior to discharge.
- Space was not occupied at the time of the incident nor was the system being monitored. We are confident had personnel been present or been notified through system monitoring that there was adequate time to investigate, locate fire condition, and take alternative measures to eliminate the condition.

If you have a suppression system, without AnaLASER® II, we would like to talk with you about the advantages it offers. Contact any of our offices.
